

Weather App Project Report

Project Overview

The Weather App is a simple desktop application developed using Python and the Tkinter library. The application provides weather information for selected cities through a graphical user interface (GUI). This project was created for learning purposes to understand GUI development and Python programming concepts. The application does not use any online API or internet connection. Instead, it uses predefined weather data stored inside the program.

Intern Details

Field	Details
Intern ID	CITS1856
Full Name	Somya Singh
Duration	4 Weeks
Project Name	Weather App using Tkinter

Project Scope

- Develop a GUI-based Python application
- Understand event-driven programming
- Learn how to use Tkinter widgets
- Display weather information dynamically
- Handle user input and conditions in Python

Features

- User-friendly graphical interface
- City search functionality
- Displays temperature, weather condition, humidity, and wind speed
- Error handling for unavailable cities
- No internet connection required
- Case-insensitive city input support

Technologies Used

- Python
- Tkinter
- Visual Studio Code

How to Run the Project

1. Install Python on your computer
2. Open the project in Visual Studio Code
3. Save the Python file with .py extension
4. Run the Python program
5. Enter a city name such as Pune, Mumbai, Delhi, or Chennai
6. Click the "Show Weather" button to view weather details

Learning Outcomes

- Basics of Python GUI development
- Working with Tkinter widgets
- Using functions and dictionaries in Python
- Handling user input
- Applying conditional statements

- Designing simple desktop applications

Conclusion

The Weather App project successfully demonstrates the use of Python and Tkinter for developing desktop GUI applications. The project improved understanding of GUI programming, event handling, and Python fundamentals while creating an interactive and functional application.
